Internal Service-Level Agreement

Document ID: OPS-003

Department: Operations

Team: Service Operations

Version: 1.0

Status: Active

Document Owner: Kavya Reddy, Operations

1. Purpose

This Internal Service-Level Agreement (SLA) defines expected response and resolution targets for internal operational requests. It establishes measurable service expectations between teams and provides a consistent method for prioritizing and tracking requests.

2. Scope

This SLA applies to internal requests submitted to Service Operations, including operational support, access coordination, vendor-related requests, service disruptions, and general business process assistance.

3. Request Priority Levels

Requests are classified into four priority levels:

Priority	Description	Initial Response Target	Resolution Target
P1 - Critical	Major disruption affecting critical business operations	15 minutes	4 hours
P2 - High	Significant service	1 hour	8 hours

	degradation affecting multiple users		
P3 - Normal	Standard operational request with limited impact	4 business hours	2 business days
P4 - Low	General information or non-urgent request	1 business day	5 business days

Response time refers to the time taken to acknowledge and begin assessing a request. Resolution time refers to the target time for completing the request.

4. Request Submission

Every request should contain:

- Requester's name and department.
- A clear description of the issue or requirement.
- Business impact and urgency.
- Relevant supporting information.
- Any affected service or vendor.

Incomplete requests may be returned for clarification. The resolution clock may be paused while essential information is pending.

5. Responsibilities

Requesting Team: Provides accurate information, responds to clarification requests, and validates the completed work.

Service Operations: Records requests, assigns priority, coordinates responsible teams, and monitors SLA compliance.

Supporting Departments: Provide technical, financial, security, or operational assistance when required.

6. Escalation

If a request is likely to exceed its resolution target, Service Operations must notify the responsible team lead.

P1 requests must be escalated immediately to the Operations lead and relevant technical or business owner.

Repeated SLA breaches must be documented and reviewed to identify the underlying cause.

7. SLA Exclusions

The following situations may affect SLA targets:

- Delays caused by missing requester information.
- Third-party vendor dependencies.
- Approved maintenance windows.
- Events covered by the Business Continuity Management Plan.
- Circumstances outside the reasonable control of the responsible team.

Any pause or adjustment must be documented with a reason.

8. Performance Review

Service Operations reviews SLA performance monthly using:

- Total requests received.
- Percentage of requests acknowledged within target.
- Percentage of requests resolved within target.
- Number of overdue requests.
- Repeated incidents and common causes.

Monthly findings should be shared with relevant department leads.

9. Review and Updates

This SLA must be reviewed every six months. Changes to response targets or resolution targets require approval from the Operations lead and affected department representatives.
